Owner: Asociatia Arca lui Noe

Patient: Mixed breed dog, 4 months, female

Surgeon: Ciprian OBER, DVM, PhD, ResECVS

Anamnesis: found on the street

Complementary exams: X Rays

Physical exam: *grade 4 lameness on the right hindlimb, with marked thigh muscle atrophy; very limited range of motion at the level of right stifle; marked cvadriiceps contracture; good general status.*

X rays: *outward rotation of the right distal femur; inward rotation of the proximal tibia with medial patellar luxation; no evidence of trochlear groove.*

Diagnosis: *severe angular limb deformity with grade 4 patellar luxation and marked cvadriiceps contracture.*

Surgery: *distal femoral osteotomy and trochlear sulcoplasty; medial retinacular release and lateral retinacular imbrication with fabello-parapatellar eight suture imbrication.*

Postoperative care: antibiotics, analgesics, cage rest.

4 weeks control xrays

physical rehabilitation after suture removal (10-12 days)
